

Working Group

API-Interoperability

Against the background of the eIDAS-Regulation ([EU No 910/2014](#)) and the recently developed Application Programming Interface (API) specifications created by [OASIS DSS-X](#) (e.g. [Core v2](#), [Metadata](#)) and [ETSI ESI](#) (e.g. [ETSI TS 119 432](#), [ETSI TS 119 442](#) and [ETSI TS 119 512](#)), the go.eIDAS Working Group “**API-Interoperability**” aims at fostering interoperability between existing and emerging eIDAS-related services.

The go.eIDAS Working Group welcomes all stakeholders within the [eIDAS-Ecosystem](#), which in particular include providers of eID-Services, Certification Authorities, Time-Stamping Authorities, Signature Generation & Sealing Services, Validation Services, Preservation Services, Electronic Delivery Services, other Trusted Services, which may or may not utilise Distributed Ledger Technologies, and last but not least **Application Services** from different public or private domains, who are interested in eIDAS and the interoperability of related services.

The Working Group “API-Interoperability” intends to maintain liaisons with relevant standardisation bodies and seeks to establish an international network of experts, which aims at enhancing the conformity and interoperability of eIDAS-related services.

The go.eIDAS Working Group will focus on technical aspects of relevant services and is intended to enhance trust and interoperability within the eIDAS domain and demonstrate the ease and smoothness of integrating eID and trust services in online-platforms in Europe and beyond.

Join this Working Group in order to make the dream of an open and interoperable eIDAS-Ecosystem come true!
